

Compiler Design

Parser

Hwansoo Han

Parser in Front End

❖ **Parser**

- Checks the stream of words and their parts of speech for grammatical correctness
- Determines if the input is syntactically well formed
- Guides checking at deeper levels than syntax
- Builds an IR representation of the code

The Study of Parsing

❖ **The process of discovering a *derivation* for some sentence**

- Need a mathematical model of syntax — a grammar G
- Need an algorithm for testing membership in $L(G)$
- Need to keep in mind that our goal is building parsers, not studying the mathematics of arbitrary languages

❖ **Roadmap**

- 1 Context-free grammars and derivations
- 2 Top-down parsing
- 3 Bottom-up parsing

Specification of Grammar

- ❖ **Syntax is specified with CFG = $\langle S, T, N, P \rangle$**

1	$Expr$	\rightarrow	$Expr Op Expr$
2			<u>number</u>
3			<u>id</u>
4	Op	\rightarrow	+
5			-
6			*
7			/

Rule	Sentential Form
—	$Expr$
1	$Expr Op Expr$
3	$\langle id, \underline{x} \rangle Op Expr$
5	$\langle id, \underline{x} \rangle - Expr$
1	$\langle id, \underline{x} \rangle - Expr Op Expr$
2	$\langle id, \underline{x} \rangle - \langle num, \underline{2} \rangle Op Expr$
6	$\langle id, \underline{x} \rangle - \langle num, \underline{2} \rangle * Expr$
3	$\langle id, \underline{x} \rangle - \langle num, \underline{2} \rangle * \langle id, \underline{y} \rangle$

- Such a sequence of rewrites is called a *derivation*
- Process of discovering a derivation is called *parsing*

We denote this derivation: $Expr \Rightarrow^* \underline{id} - \underline{num} * \underline{id}$

Derivations

- ❖ **Derivation consists of multiple steps of rewrites**
 - At each step, we choose a non-terminal to replace
 - Different choices can lead to different derivations
- ❖ **Two derivations are of interest**
 - *Leftmost derivation* — replace leftmost NT at each step
 - *Rightmost derivation* — replace rightmost NT at each step
 - These are the two *systematic* derivations
(*We don't care about randomly-ordered derivations!*)
- ❖ **The example on the preceding slide was a *leftmost* derivation**
 - Of course, there is also a *rightmost* derivation
 - Interestingly, it turns out to be different

The Two Derivations for $\underline{x} - \underline{2} * \underline{y}$

Rule	Sentential Form
—	<i>Expr</i>
1	<i>Expr Op Expr</i>
3	$\langle \text{id}, \underline{x} \rangle \text{ Op Expr}$
5	$\langle \text{id}, \underline{x} \rangle - \text{Expr}$
1	$\langle \text{id}, \underline{x} \rangle - \text{Expr Op Expr}$
2	$\langle \text{id}, \underline{x} \rangle - \langle \text{num}, \underline{2} \rangle \text{ Op Expr}$
6	$\langle \text{id}, \underline{x} \rangle - \langle \text{num}, \underline{2} \rangle * \text{Expr}$
3	$\langle \text{id}, \underline{x} \rangle - \langle \text{num}, \underline{2} \rangle * \langle \text{id}, \underline{y} \rangle$

Leftmost derivation

Rule	Sentential Form
—	<i>Expr</i>
1	<i>Expr Op Expr</i>
3	<i>Expr Op</i> $\langle \text{id}, \underline{y} \rangle$
6	<i>Expr</i> * $\langle \text{id}, \underline{y} \rangle$
1	<i>Expr Op Expr</i> * $\langle \text{id}, \underline{y} \rangle$
2	<i>Expr Op</i> $\langle \text{num}, \underline{2} \rangle$ * $\langle \text{id}, \underline{y} \rangle$
5	<i>Expr</i> - $\langle \text{num}, \underline{2} \rangle$ * $\langle \text{id}, \underline{y} \rangle$
3	$\langle \text{id}, \underline{x} \rangle - \langle \text{num}, \underline{2} \rangle * \langle \text{id}, \underline{y} \rangle$

Rightmost derivation

❖ In both cases, $\text{Expr} \Rightarrow^* \underline{\text{id}} - \underline{\text{num}} * \underline{\text{id}}$

- The two derivations produce different parse trees
- The parse trees imply different evaluation orders!

Derivations and Parse Trees (1)

Leftmost derivation

Rule	Sentential Form
—	<i>Expr</i>
1	<i>Expr Op Expr</i>
3	<i><id,<u>x</u>> Op Expr</i>
5	<i><id,<u>x</u>> - Expr</i>
1	<i><id,<u>x</u>> - Expr Op Expr</i>
2	<i><id,<u>x</u>> - <num,<u>2</u>> Op Expr</i>
6	<i><id,<u>x</u>> - <num,<u>2</u>> * Expr</i>
3	<i><id,<u>x</u>> - <num,<u>2</u>> * <id,<u>y</u>></i>

This evaluates as $\underline{x} - (\underline{2} * \underline{y})$

Derivations and Parse Trees (2)

Rightmost derivation

Rule	Sentential Form
—	$Expr$
1	$Expr Op Expr$
3	$Expr Op \langle id, \underline{y} \rangle$
6	$Expr * \langle id, \underline{y} \rangle$
1	$Expr Op Expr * \langle id, \underline{y} \rangle$
2	$Expr Op \langle num, \underline{2} \rangle * \langle id, \underline{y} \rangle$
5	$Expr - \langle num, \underline{2} \rangle * \langle id, \underline{y} \rangle$
3	$\langle id, \underline{x} \rangle - \langle num, \underline{2} \rangle * \langle id, \underline{y} \rangle$

This evaluates as $(\underline{x} - \underline{2}) * \underline{y}$

Reduction

❖ Rightmost derivation requires backward scan

- In reality, we can scan from the left and apply derivation in a reverse way

❖ Reduction

- Reverse process of derivation
- Production rule: $A \rightarrow \underline{a}\beta$
 - ◆ Derivation: replace A with $\underline{a}\beta$
 - ◆ Reduction: replace $\underline{a}\beta$ with A

- $Expr \Rightarrow Expr Op y \Rightarrow Expr Op Expr * y \Rightarrow x - 2 * y$

Reduction

Precedence in Derivations (1)

- ❖ ***These two derivations point out a problem with the grammar:***
 - *It has no notion of precedence, or implied order of evaluation*
- ❖ **To add precedence**
 - Create a non-terminal for each *level of precedence*
 - Isolate the corresponding part of the grammar
 - Force the parser to recognize high precedence subexpressions first
- ❖ **For algebraic expressions**
 - Multiplication and division, first *(level one)*
 - Subtraction and addition, next *(level two)*

Precedence in Derivations (2)

❖ Adding the standard algebraic precedence produces:

level two	1	<i>Goal</i>	→	<i>Expr</i>
	2	<i>Expr</i>	→	<i>Expr</i> + <i>Term</i>
	3			<i>Expr</i> - <i>Term</i>
level one	4			<i>Term</i>
	5	<i>Term</i>	→	<i>Term</i> * <i>Factor</i>
	6			<i>Term</i> / <i>Factor</i>
	7			<i>Factor</i>
	8	<i>Factor</i>	→	<u>number</u>
	9			<u>id</u>

This grammar is slightly larger

- Takes more rewriting to reach some of the terminal symbols
- Encodes expected precedence
- Produces same parse tree under leftmost & rightmost derivations

*Let's see how it parses $x - 2 * y$*

Precedence in Derivations (3)

Rule	Sentential Form
—	Goal
1	Expr
3	Expr - Term
5	Expr - Term * Factor
9	Expr - Term * <id,y>
7	Expr - Factor * <id,y>
8	Expr - <num,2> * <id,y>
4	Term - <num,2> * <id,y>
7	Factor - <num,2> * <id,y>
9	<id,x> - <num,2> * <id,y>

The rightmost derivation

Its parse tree

This produces $x - (2 * y)$, along with an appropriate parse tree.

Both the leftmost and rightmost derivations give the same expression, because the grammar directly encodes the desired precedence.

Ambiguous Grammars

Rule	Sentential Form
—	<i>Expr</i>
1	<i>Expr Op Expr</i>
3	<i><id, <u>x</u>> Op Expr</i>
5	<i><id, <u>x</u>> - Expr</i>
1	<i><id, <u>x</u>> - Expr Op Expr</i>
2	<i><id, <u>x</u>> - <num, <u>2</u>> Op Expr</i>
6	<i><id, <u>x</u>> - <num, <u>2</u>> * Expr</i>
3	<i><id, <u>x</u>> - <num, <u>2</u>> * <id, <u>y</u>></i>

Original choice

Rule	Sentential Form
—	<i>Expr</i>
1	<i>Expr Op Expr</i>
1	<i>Expr Op Expr Op Expr</i>
3	<i><id, <u>x</u>> Op Expr Op Expr</i>
5	<i><id, <u>x</u>> - Expr Op Expr</i>
2	<i><id, <u>x</u>> - <num, <u>2</u>> Op Expr</i>
6	<i><id, <u>x</u>> - <num, <u>2</u>> * Expr</i>
3	<i><id, <u>x</u>> - <num, <u>2</u>> * <id, <u>y</u>></i>

New choice

❖ Our original expression grammar had other problems

- This grammar allows multiple leftmost derivations for $\underline{x} - \underline{2} * \underline{y}$
- Hard to automate derivation if #choices > 1
- Both derivations succeed in producing $x - 2 * y$

Ambiguous Grammars

❖ Definitions

- A grammar G is *ambiguous*, if and only if there exists a single sentence in $L(G)$ that has multiple rightmost (or leftmost) derivations
- The leftmost and rightmost derivations for a sentence may differ, even in an *unambiguous* grammar (precedence problem)

❖ Classic example — the *if-then-else* problem

$Stmt \rightarrow$ if $Expr$ then $Stmt$
 | if $Expr$ then $Stmt$ else $Stmt$
 | ... other stmts ...

- *This ambiguity is entirely grammatical in nature*

Ambiguity

❖ This sentential form has two derivations

if E_1 then if E_2 then S_1 else S_2

if E_1
then if E_2
 then S_1
else S_2

*production 2, then
production 1*

if E_1
then if E_2
 then S_1
else S_2

*production 1, then
production 2*

Ambiguity

❖ Removing the ambiguity

- Must rewrite the grammar to avoid generating the problem
- Match each else to innermost unmatched if (*common sense rule*)

1		$Stmt \rightarrow WithElse$
2		$NoElse$
3		$WithElse \rightarrow \underline{if} \ Expr \ \underline{then} \ WithElse \ \underline{else} \ WithElse$
4		$OtherStmt$
5		$NoElse \rightarrow \underline{if} \ Expr \ \underline{then} \ Stmt$
6		$\underline{if} \ Expr \ \underline{then} \ WithElse \ \underline{else} \ NoElse$

Intuition:

Between then and else, only *WithElse* can go, but *NoElse* cannot.

❖ With this grammar, the example has only one derivation

Ambiguity

❖ if E_1 then if E_2 then S_1 else S_2

Rule	Sentential Form
—	$Stmt$
2	$NoElse$
5	<u>if</u> $Expr$ <u>then</u> $Stmt$
?	<u>if</u> E_1 <u>then</u> $Stmt$
1	<u>if</u> E_1 <u>then</u> $WithElse$
3	<u>if</u> E_1 <u>then</u> <u>if</u> $Expr$ <u>then</u> $WithElse$ <u>else</u> $WithElse$
?	<u>if</u> E_1 <u>then</u> <u>if</u> E_2 <u>then</u> $WithElse$ <u>else</u> $WithElse$
4	<u>if</u> E_1 <u>then</u> <u>if</u> E_2 <u>then</u> S_1 <u>else</u> $WithElse$
4	<u>if</u> E_1 <u>then</u> <u>if</u> E_2 <u>then</u> S_1 <u>else</u> S_2

- This binds the else controlling S_2 to the inner if

Resolve If-Then-Else with Precedence

❖ **Precedence enforces which operation to apply first**

- If we have choices between If-Then and If-Then-Else apply If-Then-Else first (higher priority)

❖ **if E_1 then if E_2 then S_1 else S_2**

- When we need to reduce for
 $\underline{\text{if}}\ E_2\ \underline{\text{then}}\ S_1\ \underline{\text{else}}\ S_2$

choose If-Then-Else instead of If-Then

$\underline{\text{if}}\ E_1\ \underline{\text{then}}\ \textit{Statement} \Rightarrow \underline{\text{if}}\ E_1\ \underline{\text{then}}\ \boxed{\underline{\text{if}}\ E_2\ \underline{\text{then}}\ S_1\ \underline{\text{else}}\ S_2}$

$\xleftarrow{\text{reduction}}$

Deeper Ambiguity

- ❖ **Ambiguity usually refers to confusion in the CFG**

- ❖ **Overloading can create deeper ambiguity**

a = f(17)

- In many Algol-like languages, *f* could be either a function or a subscripted variable (i.e. array access)

- ❖ **Disambiguating this one requires context**

- Need values of declarations
- Really an issue of *type*, not context-free syntax
- Requires an extra-grammatical solution (not in CFG)
- Must handle these with a different mechanism
 - ◆ Step outside grammar rather than use a more complex grammar
 - ◆ Context-sensitive analysis

Summary

❖ **Derivation**

- Leftmost derivation or rightmost derivation
- Precedence is needed to get intended parse-tree
- Two more derivations \Rightarrow ambiguous grammar
